S.U.P.E.R.M.A.N. Deployment Guide

Secure & Enforced macOS Updates with Jamf Pro

Key Policy Objectives

30

Day Grace Period

Updates are ignored for 30 days post-release for testing.

5

User Deferrals

Users can postpone the update 5 times.

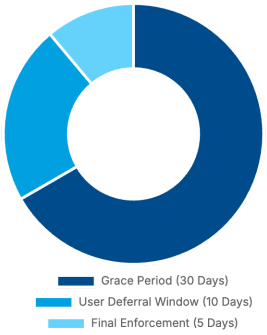
24

Hour Deferral

Each deferral lasts for 24 hours.

45-Day Enforcement Window

This chart shows the breakdown of the update lifecycle, starting from the end of the 30-day grace period.



Update Enforcement Timeline (User Experience)

Day 0: OS Update Released

Apple releases a new macOS update. The `DaysDeadlineStart` key is activated.

Day 30: Grace Period Ends

The 30-day testing window is over. S.U.P.E.R.M.A.N. begins its workflow, downloads the update, and starts prompting the user with 5 deferrals.

Day 40: Soft Deadline

All 5 deferrals are used or 10 days have passed. The update dialog becomes more persistent and can't be timed out (`DialogTimeoutSoftDeadline`).

Day 45: Hard Deadline

The `HardDeadlineDays` is reached. The update is mandatory, and the device will be forced to restart and install the update.

Secure Jamf Pro Setup (API Client)

This 2-part process ensures S.U.P.E.R.M.A.N. authenticates securely using Jamf's modern API Client method, not an admin user account.

Step 1: Create API Role

Define *what* the script can do. Grant these minimum privileges:

- **Read** Computers
- **Create/Read** Managed Software Updates
- **Send** Remote Command (Download and Install OS X Update)

→

Step 2: Create API Client

Create the credentials and link the Role. This gives you the Client ID & Secret.

- **Token Expiration:** Set to **60 minutes** for best security.
- **Record ID & Secret:** Securely copy the generated credentials.

Jamf Policy Deployment

Finally, deploy the script and securely pass the API credentials (ID and Secret) as encrypted parameters in the policy.

Jamf Pro Policy
Set Frequency: "Once per computer"

+

Script Payload
Add `super` script

+

Encrypted Params
P4: --auth-jamf-client
P5: --auth-jamf-secret
